Waste minimization efforts for the waste streams on this report include reduction at the point of generation and processing to reduce the volume managed as a hazardous waste.

- The following are active waste minimization efforts to reduce the volume of sludge accumulated in the Refinery process sewer system and the API oil water separators; generator training that emphasizes the importance of housekeeping and minimization of solids getting into the effluent system, the diversion of clean storm water away from the oily water process sewers, and street sweeper operations to prevent clean soil from entering process sewers.
- Hydrocarbon contaminated sludges and tank bottoms are processed on site to separate the recoverable oil from the solids that are managed as a hazardous waste. The Primary oil/water/solids separation sludge (F037), API Separator Sludge (K051), and Crude Oil Storage Tank Sediment (K169) were processed through a centrifuge operation to recover free hydrocarbon prior to management as a listed hazardous waste.

The number of tanks scheduled for cleaning and the product stored in the tank has a significant impact on the volume of sludge generated during any given year. The Primary oil/water/solids separation sludge (F037) information, reported for 2013, includes sludge from the Refinery Process Sewer system, tank bottoms from a heavy cycle oil tank, and excavated soil comingled with primary sludge.
